

Generalized Convexity and Nonsmooth Optimization

Diethard Pallaschke

Contents of the lecture:

1 Convexity

- 1.1 Convexity in infinite-dimensional Spaces
- 1.2 DC-Functions

2 Generalized Convexity

- 2.1 Reference Systems for Lipschitz Functions
- 2.2 Reference Systems of Smooth Functions
- 2.3 Augmented Lagrangians
- 2.4 Duality

3 Equivalent Formulations of the Variation Principle

4 The Generalized Directional Derivative

- 4.1 The Clarke Subdifferential
- 4.2 Convex Functions and Piecewise Smooth Functions
- 4.3 Optimality Conditions

5 Point derivations

- 5.1 The generalized derivative and point derivations
- 5.2 Algebraic Characterization of Critical Points

6 Critical Points of Lipschitz Functions

7 Quasidifferentiable Functions

- 7.1 Quasidifferential Calculus
- 7.2 Minimal Representation of Quasidifferentials
- 7.2 Optimality Conditions

8 Basic Morse Theory

9 Smooth Optimization Problems

- 9.1 The Feasible Region of Smooth Optimization Problems
- 9.2 Smooth Manifolds with generalized Boundary
- 9.3 The Karush-Kuhn-Tucker Conditions
- 9.4 Morse Vector-Functions and Critical Points
- 9.5 Necessary Optimality Conditions
- 9.6 The Manifold of Karush-Kuhn-Tucker Points
